

HOW TO CHOOSE THE RIGHT SNORKEL

Snorkels are divided into basically two types:

(i) Basic type

When using this type of snorkel you need more effort to remove the water from the mouthpiece because you have to blow with more force the water out of the tube of the snorkel up to the top part of it.

(ii) With purge valve

When using this type of snorkel you need less effort to remove the water from the mouthpiece because some quantity of water will be blown out from the purge non return valve which is placed next to the mouthpiece and therefore blow water out with less force than from the first type of snorkel, for the rest of the water to go out of the tube of the snorkel up to the top of part of it.
